On Thursday, September 27, 2018, she will be performing screening breast thermograms and appointments are available.

Breast Thermography is a noninvasive, inexpensive test that does not involve breast compression or radiation exposure. While it does not replace mammograms, thermography is FDA-approved since 1982 as an adjunctive tool for breast health screening. It measures infrared heat from the tissues, using technology like color weather maps; increased heat can be a signal of new blood vessel growth feeding a tumor. Thermography can enhance early detection of most fast-growing breast cancers, and is especially useful for women with dense breasts or premenopausal.

The initial Breast Thermogram results are interpreted by Board-Certified Medical Doctor, and mailed to the client within 10 days. A copy of the interpretation can go to your physician of choice. Please call for pricing.

Please call 864-850-9988 to make an appointment.
